

Speaker

Select the speaker size and number of speakers for your cabinet. The first number indicates the number of speakers while the second indicates speaker size in inches. More and larger speakers translates to higher volume

Microphone

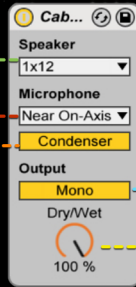

Select the position of the virtual microphone in relation to the cabinet. Near **On-Axis** is bright and focused. Near **Off-Axis** is resonant and less bright. **Far** is a balanced sound with some "room" characteristics

Microphone Type

Choose between a **Dynamic** and **Condenser** mic.

Dynamic is grittier and common for close-micing guitar cabinets because they can handle higher volumes.

Condenser's are more accurate and usually used for micing from a distance

Output

Select either **mono** or **dual** (stereo) output. **Dual** uses twice as much CPU

Dry/Wet

Control the balance of your **wet** and **dry** signal
